Artificial rain fall device development

The system of Artificial rain fall device is like sprinkling substance of the rain drops in the cloud. It prompt rainfall artificially. This device use silver iodide as seeds of rain drops in substance.

By burning and making smoke the silver iodide acetone solution in the device, a particle of silver iodide go onto the cloud in the sky. The silver iodides assemble water vapor and change the ice drop crystal, fall down, and change into the rain.

Tokyo Waterworks has installed and introduced the device as a first water utility in Japan.

Tama River Water Resources Forest Team

Tokyo Waterworks manages a half of forests in upper Tama River area, as a water resources forest, to supply safe and tasty water for our customer.

However, nowadays deterioration of forest advances as insufficient of maintenance because of slump in forest business in some part of private forest.

In FY2002, in order to regenerate green forest as appropriate water resource forest, we established

“Tama River Water Resources Forest Team” .

This team is mainly formed by volunteer, and making efforts to protect water conservation forest constantly.
