

A amazing facts on Tokyo's waterworks!

This place of Tokyo Waterworks is amazing

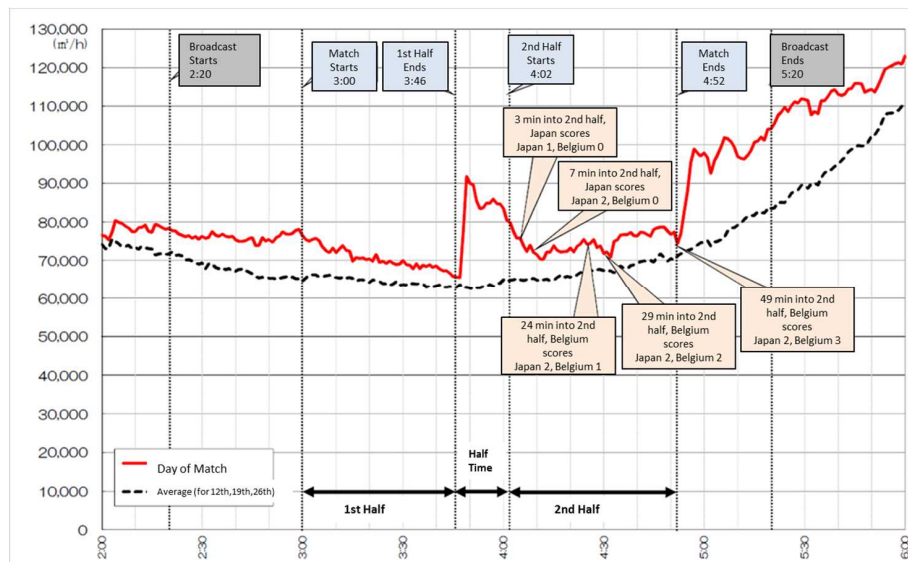

Fine-tuning to Maintain Appropriate Water Levels and Pressure

The Tokyo Waterworks works 24/7 to closely monitor and react to any changes in water usage.

When large changes in water usage occur, an alert is sent out.

After quickly confirming the alert, waterworks staff order the activation of the pumps, adjusting them to ensure proper water volume and pressure.

In addition, since sudden increases and drops in usage often occur during events such as soccer matches and the Olympics, adjustments in water pressure are made in advance.

Issued on September 2018

Welcome to Tokyo Waterworks Technical Magazine. This publication is a limited 7-issue web magazine packed with tourist information centered around water in the exciting capital city of Tokyo. Readers will also find information on water infrastructure technologies that support Greater Tokyo's essential utilities.

Tokyo Waterworks Magazine is comprised of the following sections. Enjoy!

Tokyo Travel meets Water

Find tourist information and other useful tips for your stay in Tokyo here. Of course, there's also plenty of info on the city's waterworks within!

2018 IWA World Water Congress Exhibition

This section contains the latest information on the World Water Congress to be held in September, 2018.

Amazing facts on Tokyo's waterworks!

Here you'll find articles on Tokyo's amazing waterworks technology, featuring photographs lovingly taken by local staff. Get to know our dedicated staff here!

Tokyo Travel meets Water ~ DAY 4 ~

In your daily life, do you ever consider how precious and limited a resource water is? Do you know how much water there is in the entire world?

There is said to be 1.4 billion km³ of water on earth, of which about 97.5% is saltwater with fresh water accounting for the remaining 2.5%. What's more, of this fresh water, usable water from rivers and lakes makes up a mere 0.01% of all the world's water.

While Japan is located in the Asian monsoon region - an area with one of the heaviest average rainfalls in the world, it cannot be said to be blessed in this regard. The country's per capita precipitation is only a fourth of the global average, due to Japan's small area and large population.

The IWA International Water Conference, which is starting from Sunday, September 16, 2018, will be a great chance to consider the world's water challenges.

Why not take this opportunity to visit the convention yourself and start seriously thinking about the water-related issues facing our world?

Participants in the forum at Tokyo Big Sight will receive a complimentary water bottle! See the following page for details!
